

Xilinx in Automotive

Willard Tu, senior director, automotive

Agenda

Background on Xilinx's automotive business

Today's News: Xilinx and Daimler

What's Next: Xilinx's powerful,
new ACAP architecture

About Xilinx

Pioneer and leader in field-programmable gate arrays (FPGA) and programmable system-on-a-chip (SoC) devices

➤ High-performance, highly scalable programmable silicon with distinct benefits

Handles extremely complex computing tasks

Allows creation of custom applications and can be reprogrammed as design evolves

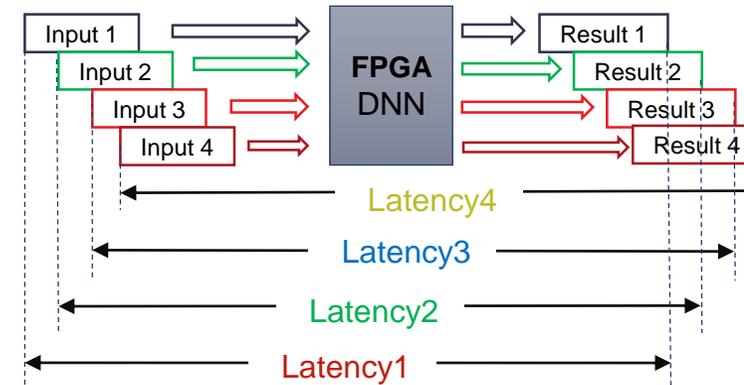

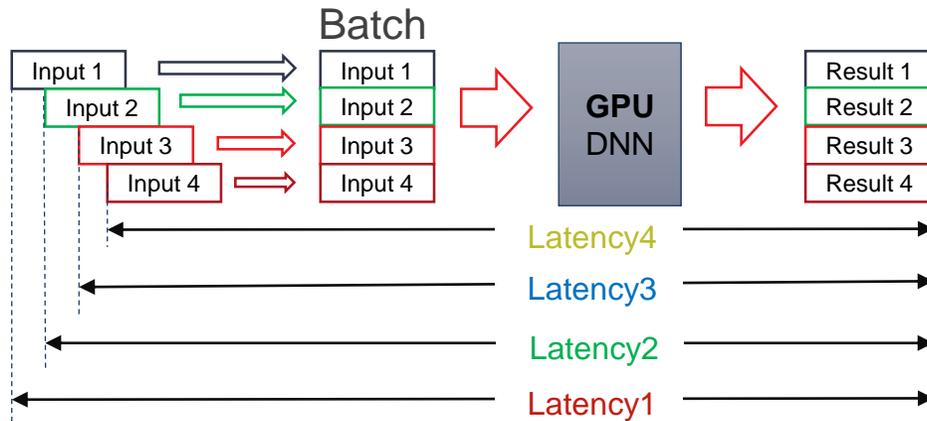

Programmable SoC lines integrate powerful CPUs: software, hardware and I/O programmability in a single chip

Is driving innovation in many industries including aerospace/defense, ASIC prototyping, audio, automotive, broadcast and AV, consumer electronics, data center, medical, wired and wireless communications and more

FPGA Benefits: Low Latency, High Throughput

➤ Inference with batches

- Require parallel batch of data for SIMD
- High batch => high latency, higher throughput
- Lower compute efficiency at low batch

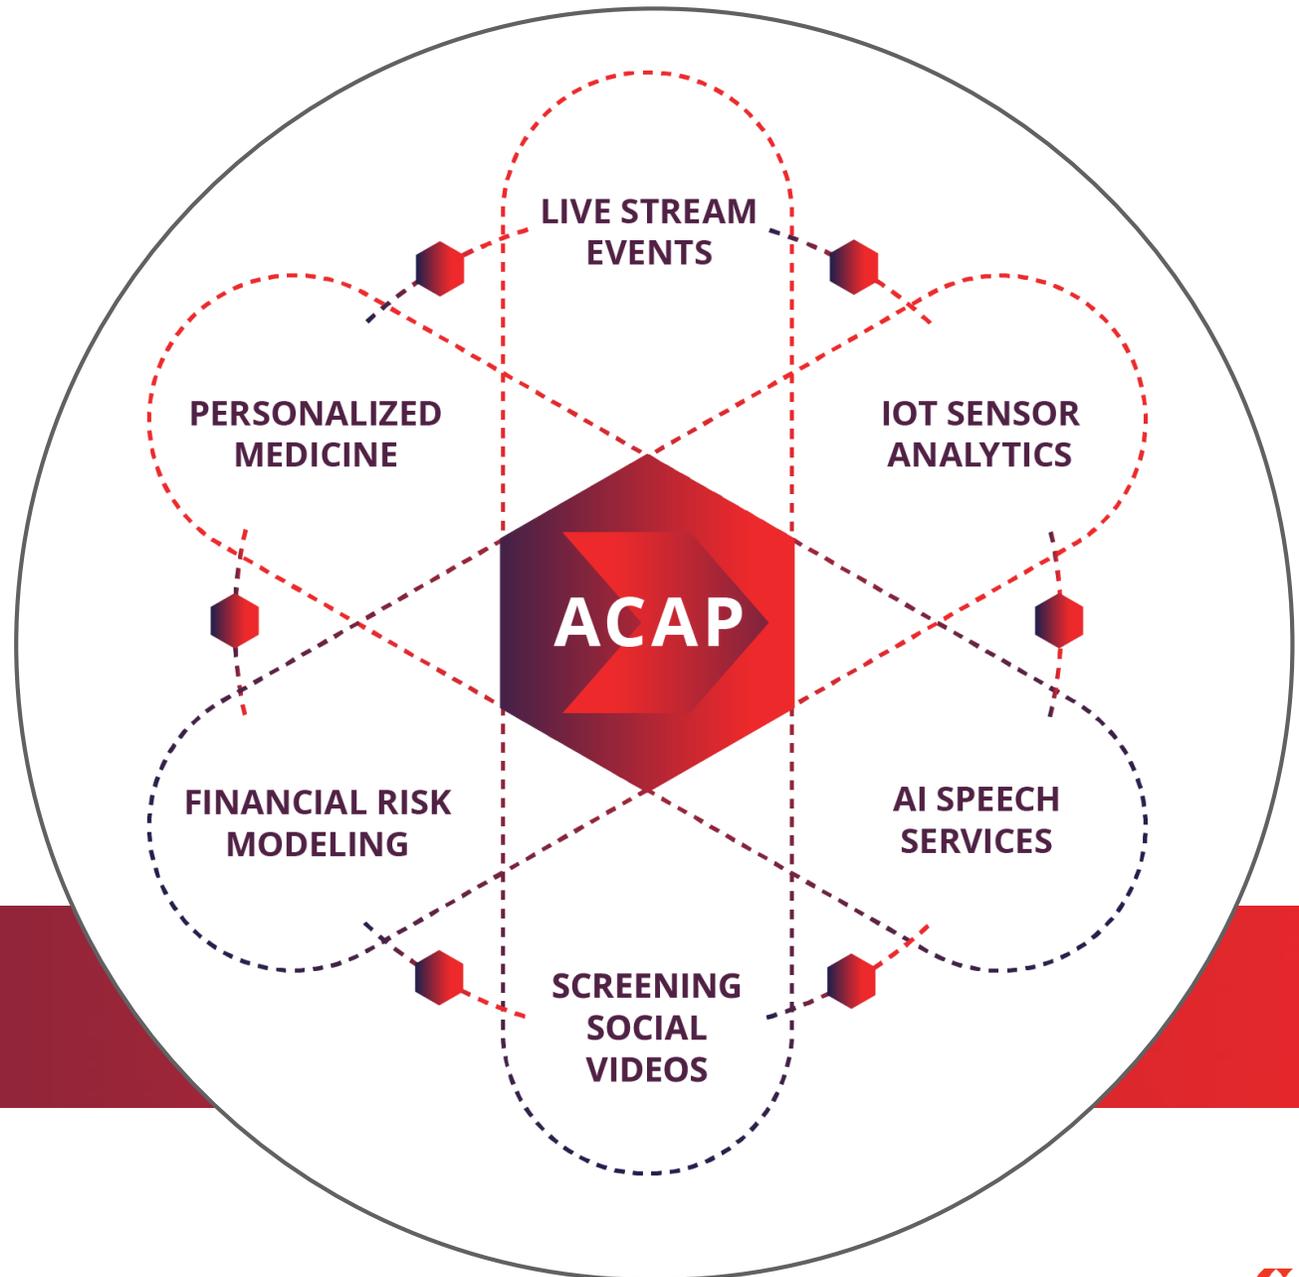

➤ “Batch-less” inference

- Low and deterministic latency
- High throughput regardless of batch size
- Consistent compute efficiency

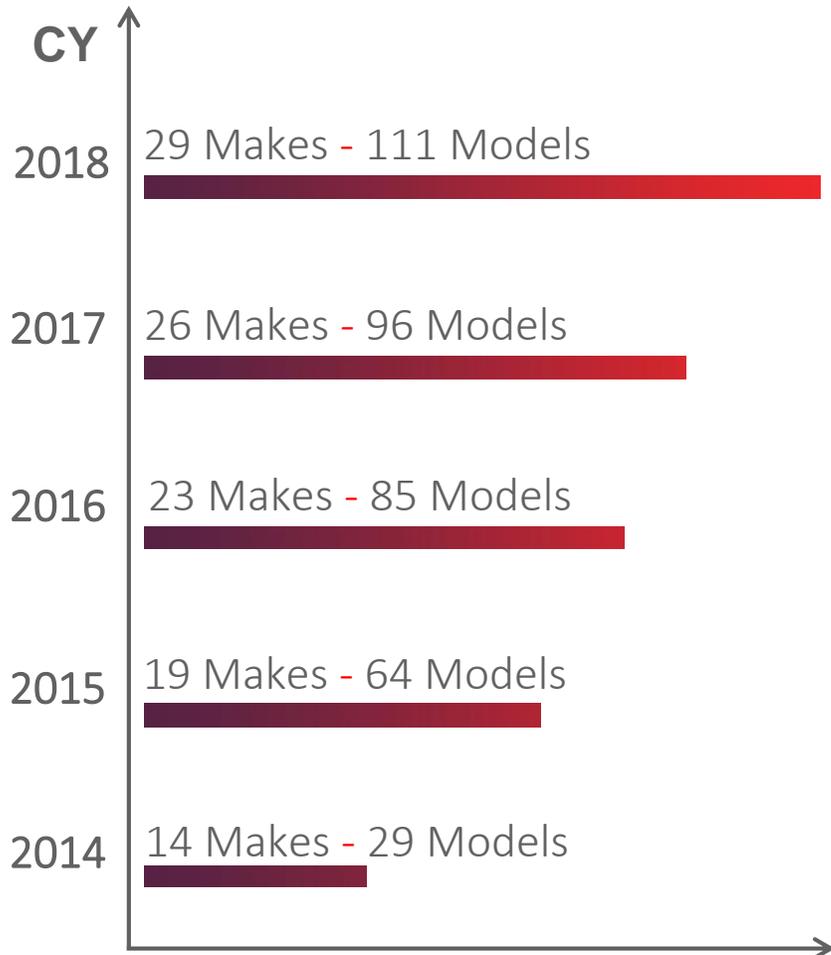

Customers, from edge to Cloud,
require low latency inference (batch=1)

What's Next: ACAP

Next-generation technology announced earlier this year—**adaptive compute acceleration platform (ACAP)**—will exceed traditional CPUs and GPUs in performance

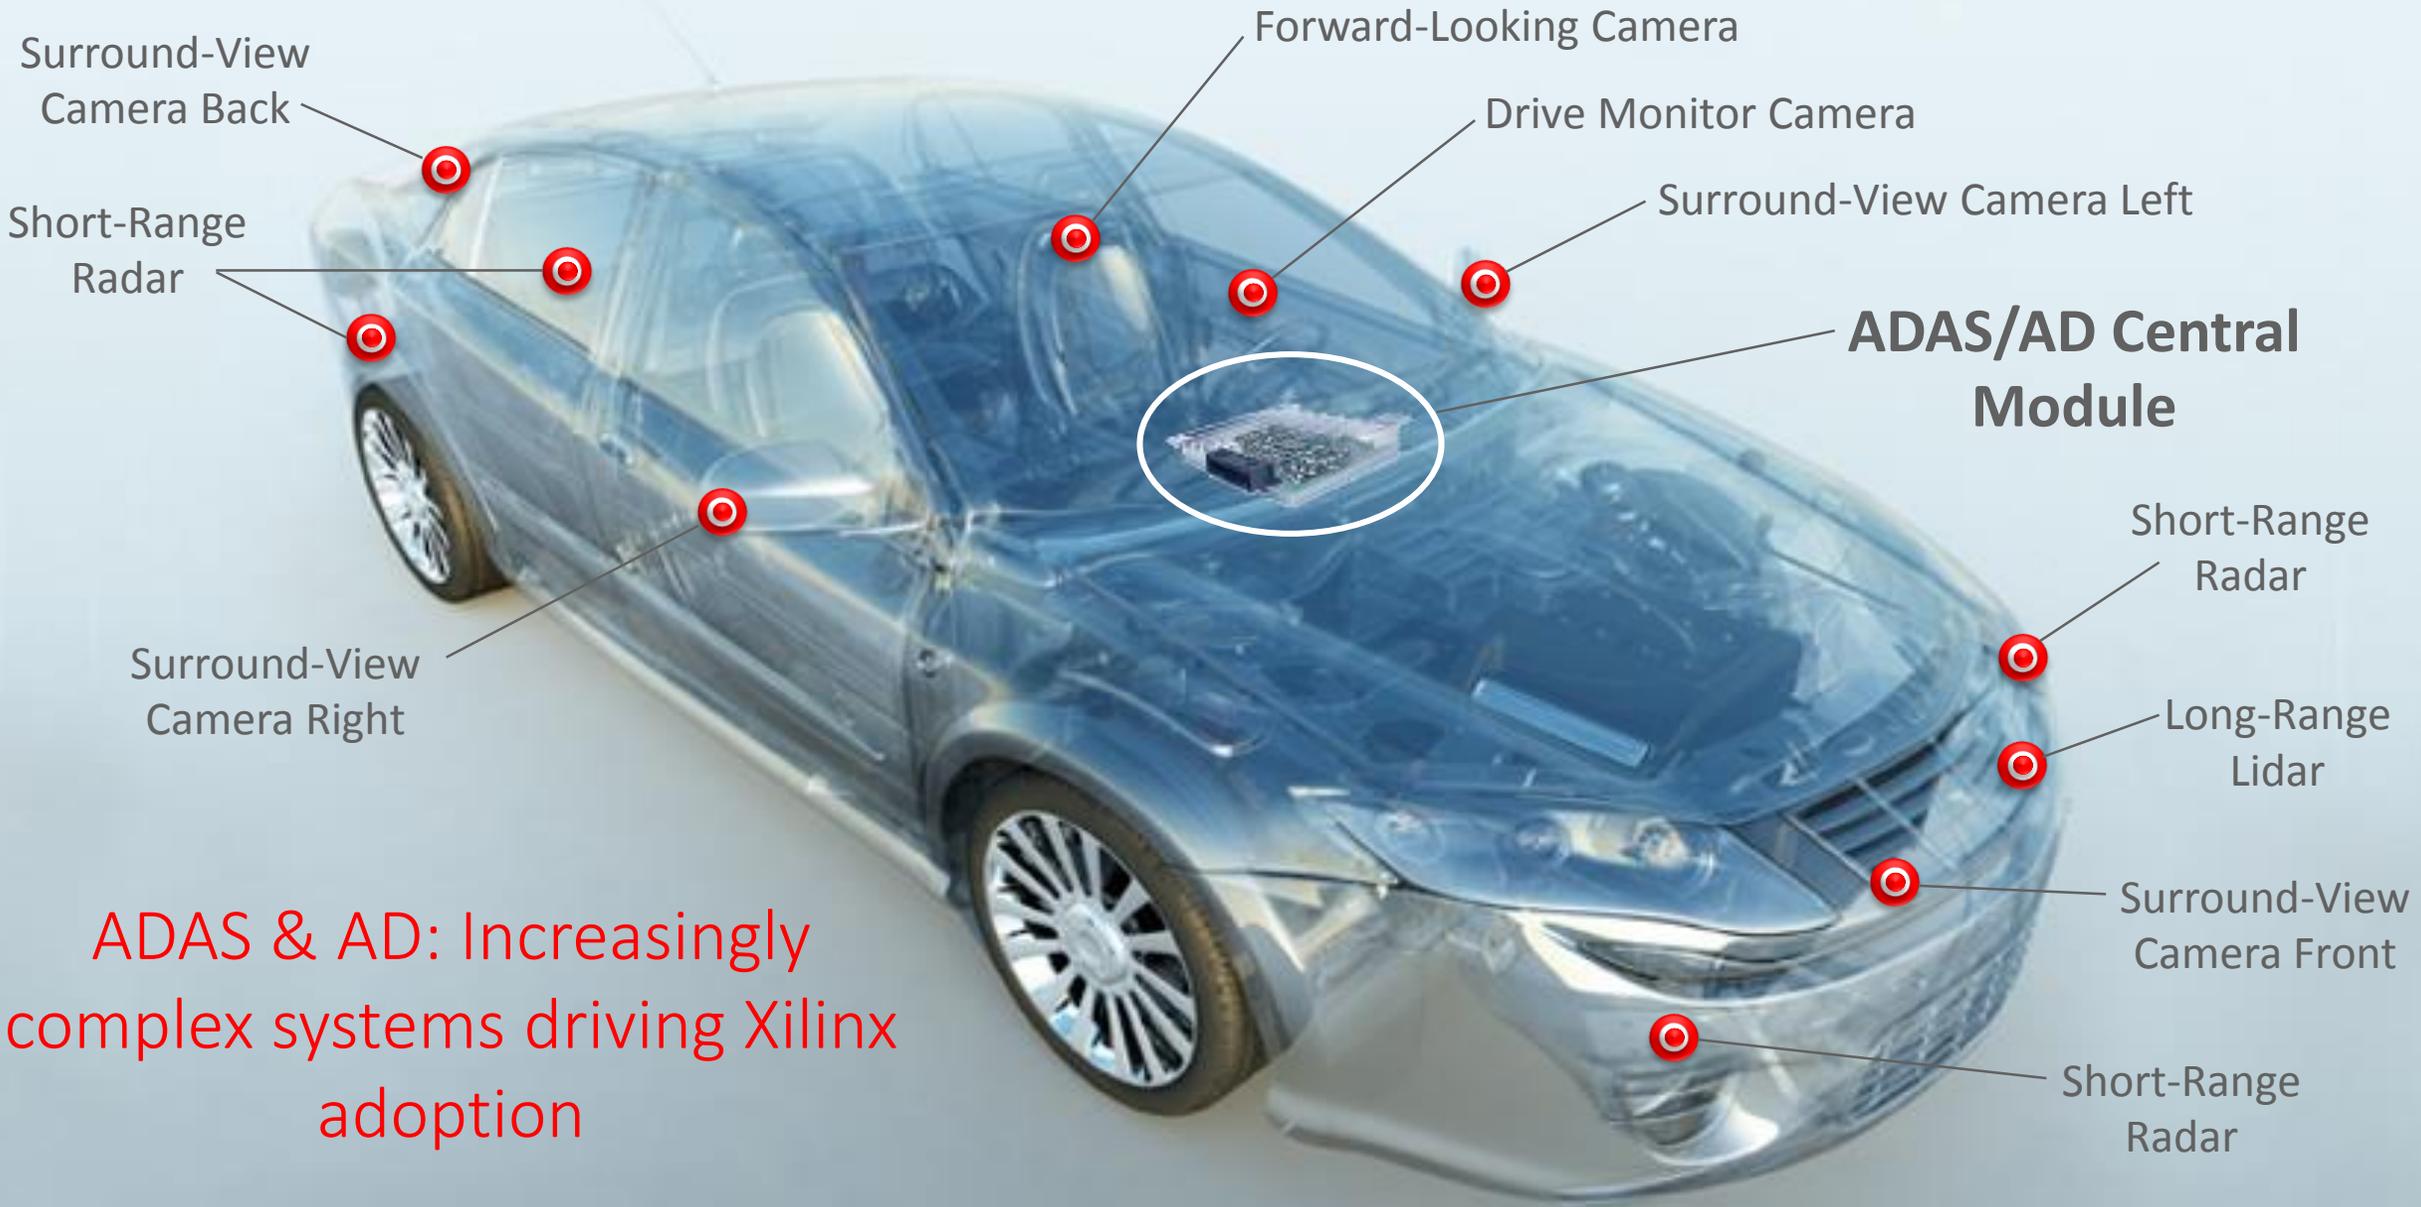

Xilinx's Steady Growth in Automotive

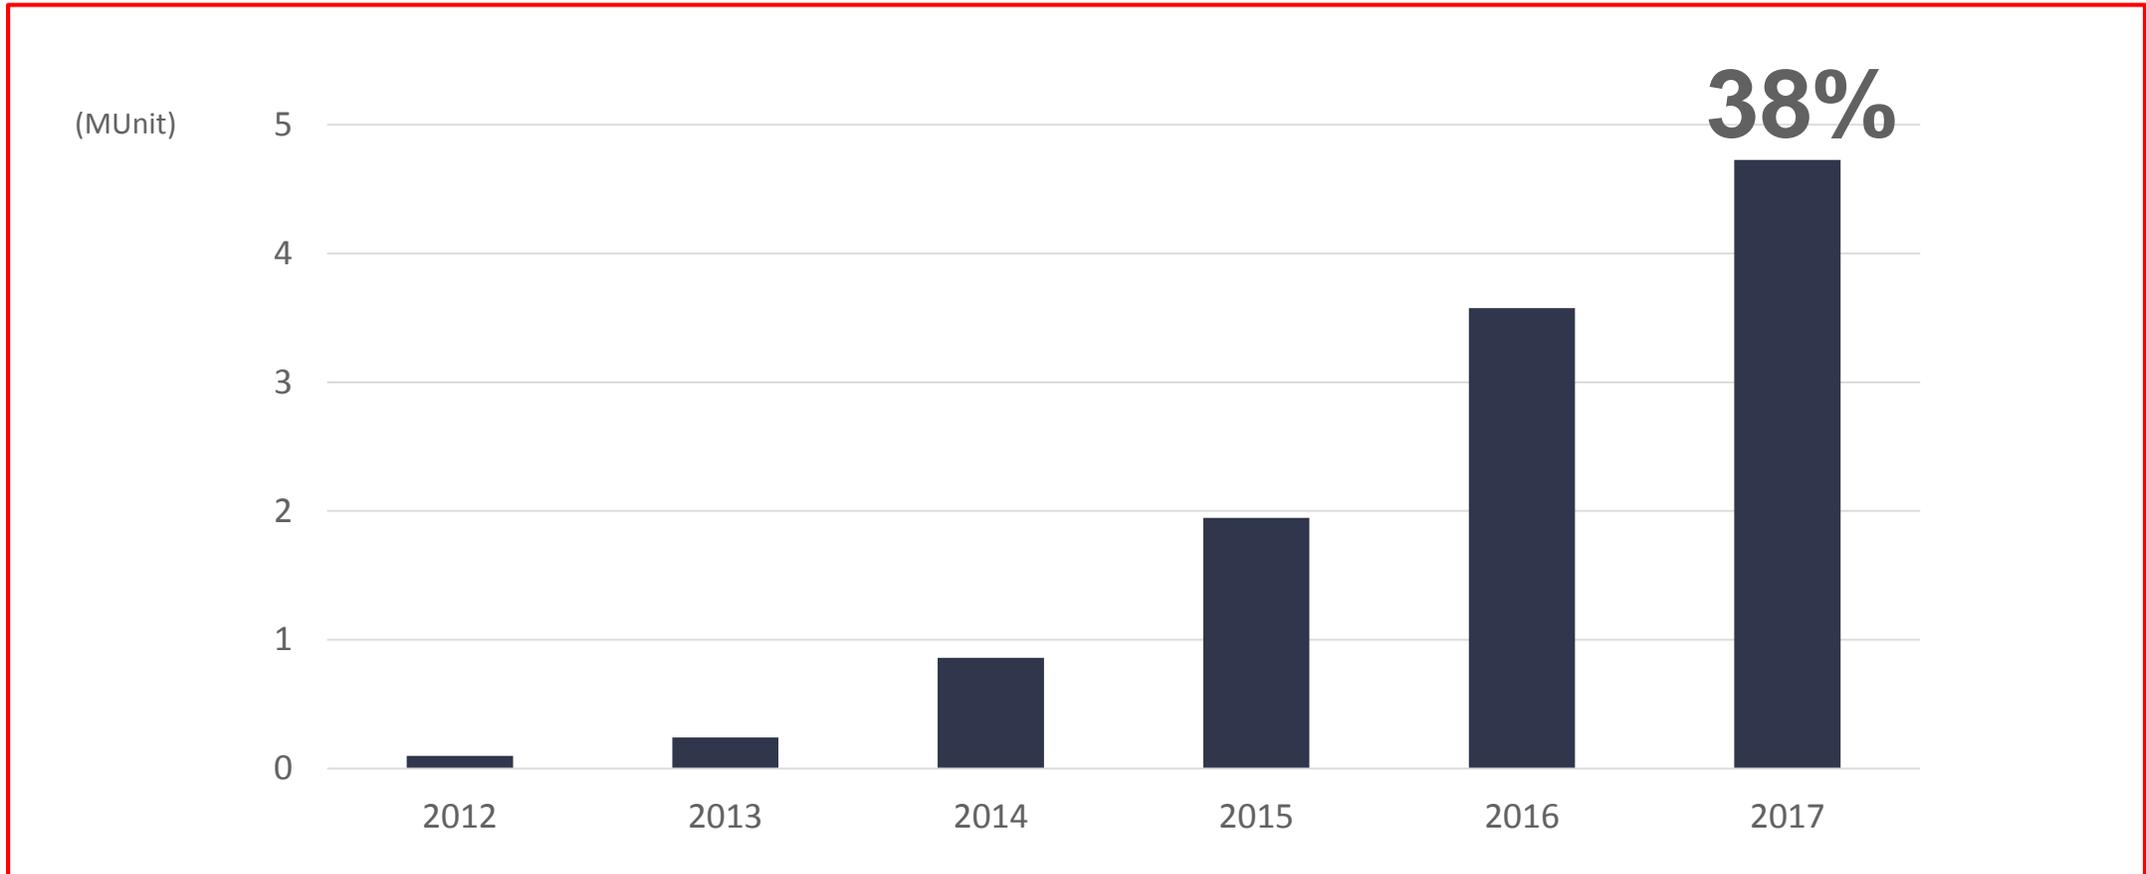

Tier 1 Suppliers

OEMs

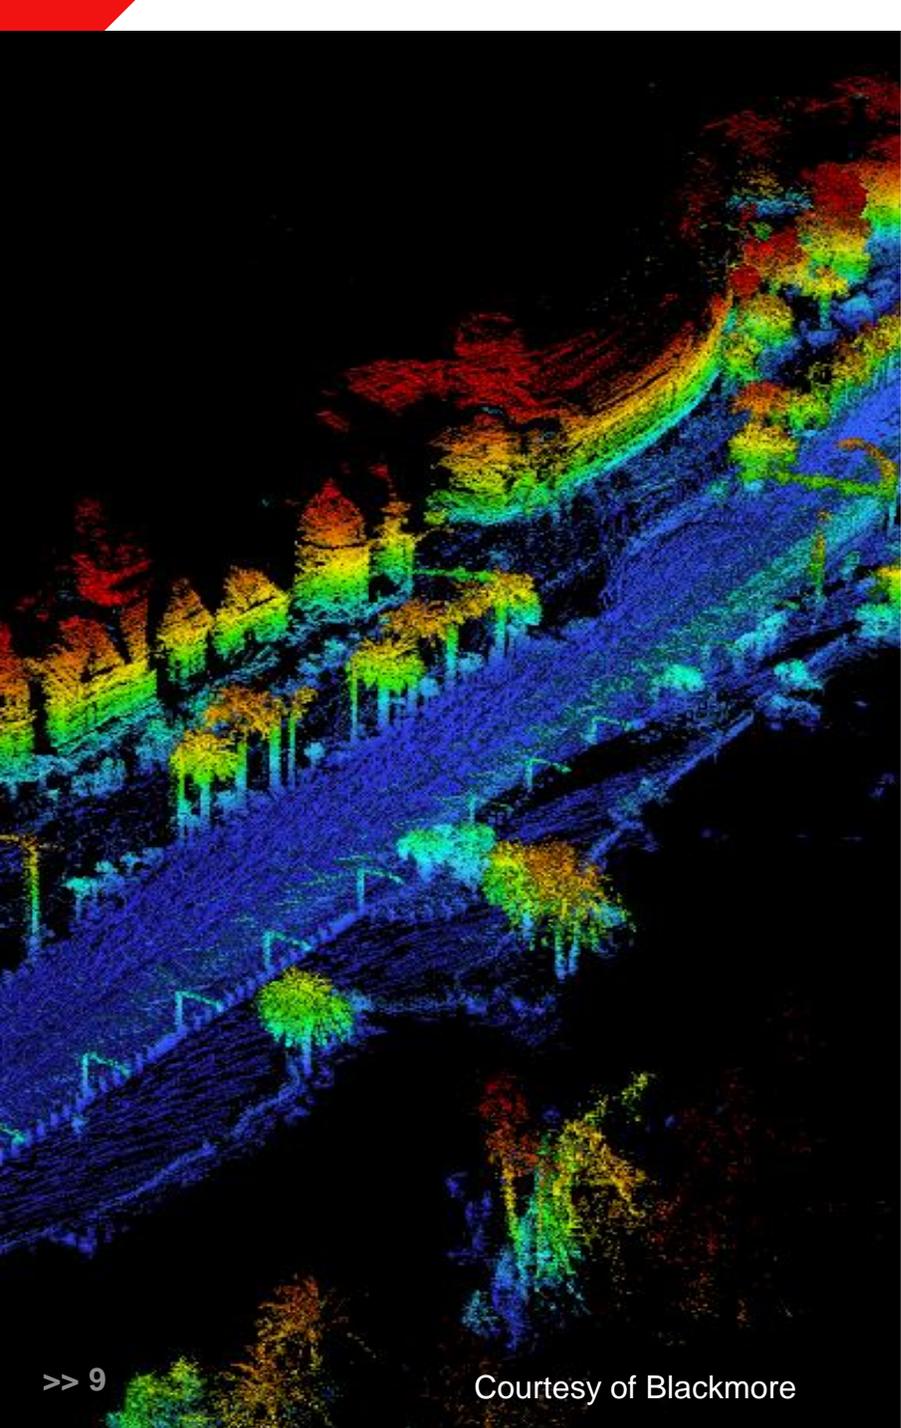

ADAS & AD: Increasingly complex systems driving Xilinx adoption

Front Camera Units/Shipments and Share

TAM: IHS Markit 2017 | Xilinx SOM: shipment from Four Tier1s based in Japan and EU

At the Forefront of Emerging Lidar Sensors

Estimated market share >90%

➤ Several major Tier 1s

➤ Most start-ups

Suitable for all Lidar technologies

What's next: 4D Imaging Radar Complexity Demands Xilinx Power

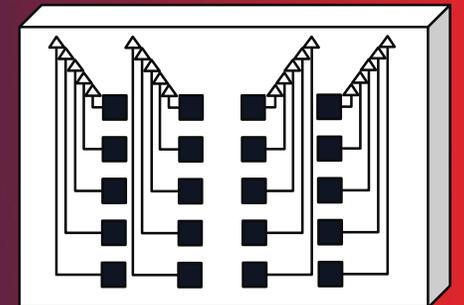

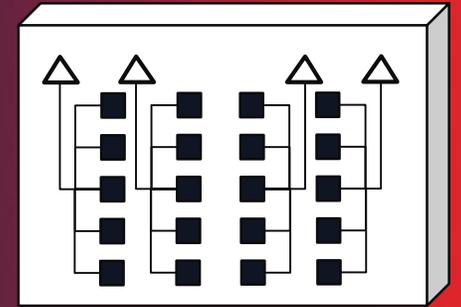

4D Radar refers to an RF sensor that determines an object's location in Range (1), Azimuth (2) and Elevation (3), and the object's Relative Range Rate (4)

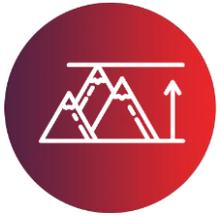

Most of today's automotive radar locate objects in range and azimuth only

- These radars combine column elements of planar array antenna

What's next: 4D Imaging Radar Complexity Demands Xilinx Power (continued)

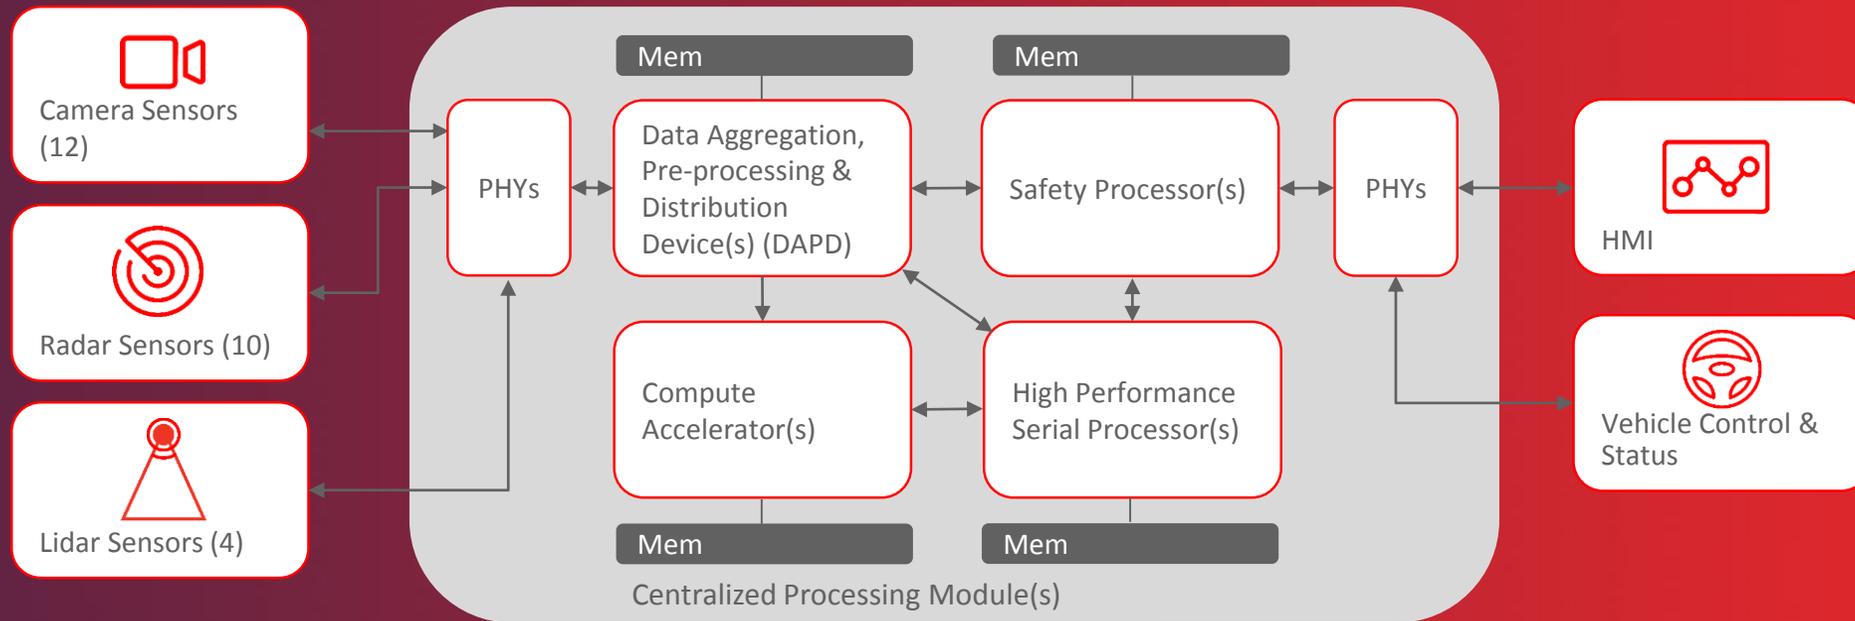

Adding the elevation location measurement can result in a dramatic increase in the number of receive channels and corresponding processing performance

- Each antenna element is associated with its own independent feed/channel
- This leads to the opportunity for digital beam forming in the processor

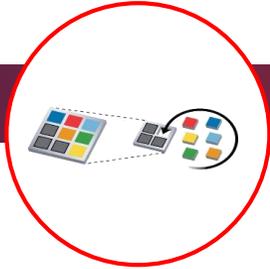

Therefore, 4D radar demands extensive use of simultaneous processing pipelines, which can be realized in Xilinx Programmable Logic fabric

Why Xilinx for Autonomous Driving

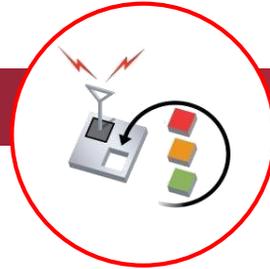

- > Front-end of an emerging application space = instability of designs
- > 100x more complex than ADAS
- > OEMs want to own & differentiate
- > Scalability

Achieving More with Less

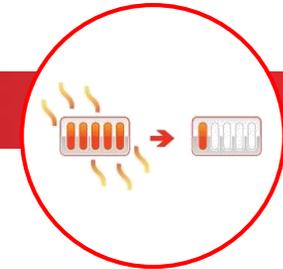

Dynamic Function eXchange (DFX)

- Using the same device for mutually exclusive functions
- Time-multiplexing hardware requires smaller device
- System cost and size reduction with fewer devices

OTA Silicon

- Over-the-air update to enable upgradability for software AND hardware
- Add new features or update mission critical functions, e.g. security algorithms

Thermal Dissipation Reduction

- Use smaller or/and fewer devices
- Swap out power-hungry tasks
- Optimized performance/watt

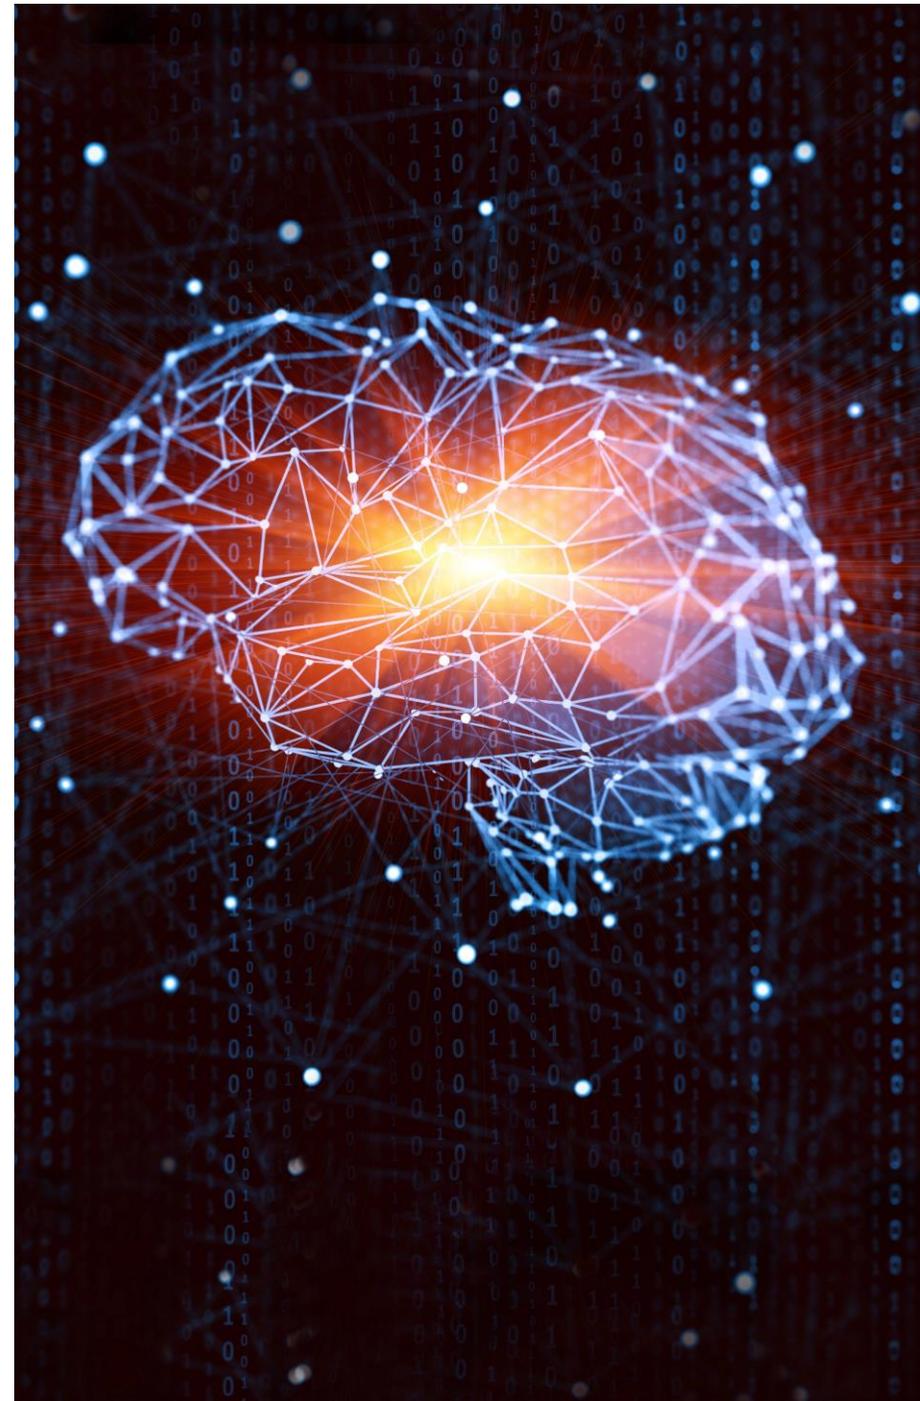

Today's News: Daimler Selects Xilinx for AI-based Auto Applications

DAIMLER

“Xilinx is providing technology that will enable us to deliver very low latency and power-efficient solutions for vehicles that must operate in thermally constrained environments. We have been very impressed by Xilinx’s heritage and selected the company as a trusted partner for our future products.”

~ Georges Massing, Director User Interaction & Software, Daimler AG

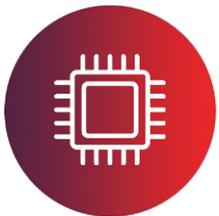

What's Next: Xilinx ACAP

Announced in March, new device category

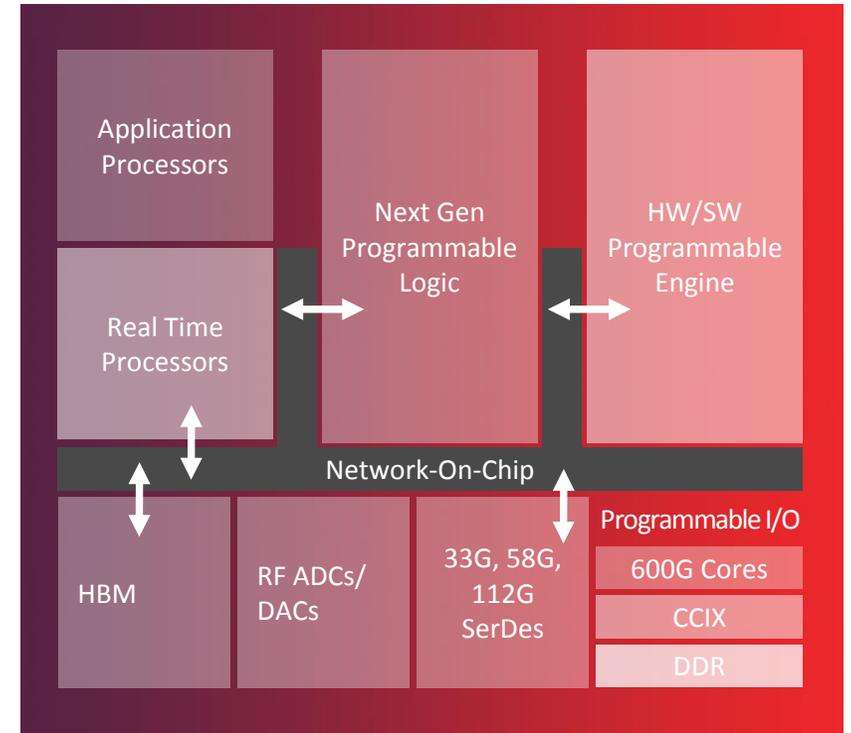

- Enables workload-specific acceleration
- Hardware/software-programmable engines, IP subsystems and a network-on-chip, highly integrated programmable I/O

Will power cameras up to 8MP and enable systems up to Level 3, handling urban and highway scenarios

Benefits include higher bandwidth channels; high-performance/low power consumption; high performance/low power CNN Processing for environment Cognition; expected to advance functional safety

A long, straight road stretches towards snow-capped mountains at sunset. The sky is a mix of orange and yellow, with some clouds. The road has a double yellow line in the center and white lines on the sides. The mountains are in the background, and there are some power lines on the left side of the road.

The Road Ahead

Building the
Adaptable Intelligent World

Adaptable.
Intelligent.
