System Software & SoC Solutions – Product and Technical Marketing

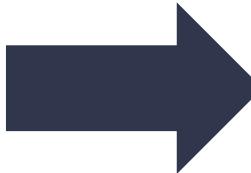

If Microsoft ever does applications for Linux it means I've won.

-Linus Torvalds, 1998

When software developers drive hardware design it means adaptable SoC's have won.

-Xilinx, 2018

Installation guidance for SQL Server on Linux

04/05/2018 • 6 minutes to read • Contributors

APPLIES TO: SQL Server 2017
This article provides

This guide covers some of the quickstarts:

- RHEL quickstart
- SLES quickstart
- Ubuntu quickstart
- Docker quickstart

For answers to frequently asked questions, see the [FAQ](#).

Supported

SQL Server 2017 is supported as a Docker container on the following platforms:

- Platform**
- Red Hat Enterprise Linux
 - SUSE Linux Enterprise Server
 - Ubuntu
 - Docker Engine

Windows 10 Fall Creators Update

This section is for Windows 10 Fall Creators Update. To learn more, follow [these instructions](#).

1. Open the Microsoft Store
2. Search for "SQL Server"
3. Download and install

Microsoft Store

Home Apps Games

Install the Windows Subsystem for Linux

Before installing any Linux distribution, make sure that the Windows Subsystem for Linux extension is enabled.

Tip

This guide covers some of the quickstarts:

- RHEL quickstart
- SLES quickstart
- Ubuntu quickstart
- Docker quickstart

For answers to frequently asked questions, see the [FAQ](#).

Install your Linux distribution

To download and install your Linux distribution, follow the instructions for your platform.

1. Download and install the Linux distribution
2. Download and install the Windows Subsystem for Linux
3. Download and install SQL Server

Windows 10 Fall Creators Update

This section is for Windows 10 Fall Creators Update. To learn more, follow [these instructions](#).

1. Open the Microsoft Store
2. Search for "SQL Server"
3. Download and install

Microsoft Store

Home Apps Games

Why Microsoft chose Linux for Azure Sphere

Apr 19, 2018 — by Eric Brown — 3642 views

Please share:

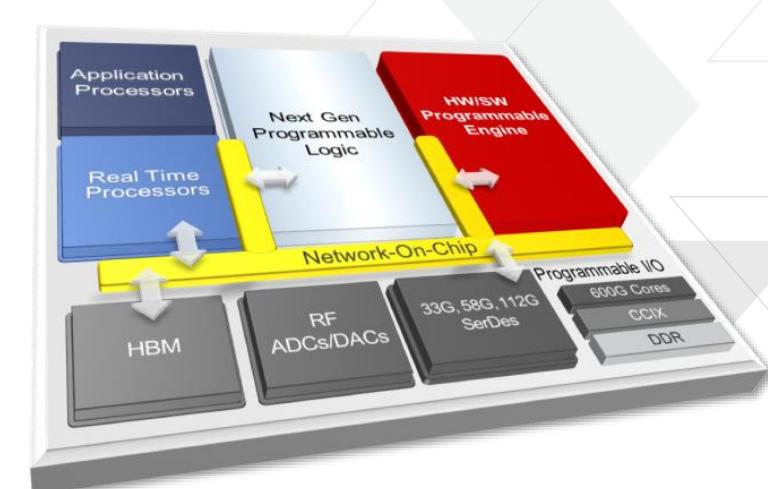

Why did Microsoft choose to launch an Arm/Linux SoC design with device-to-cloud security? A VDC analyst suggests that Azure Sphere is all about competing with Amazon FreeRTOS.

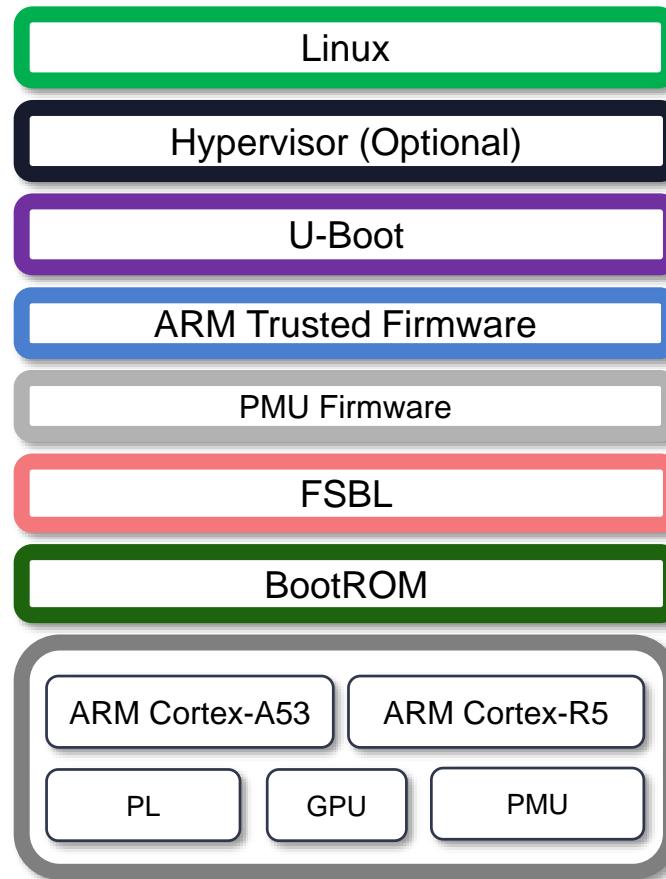

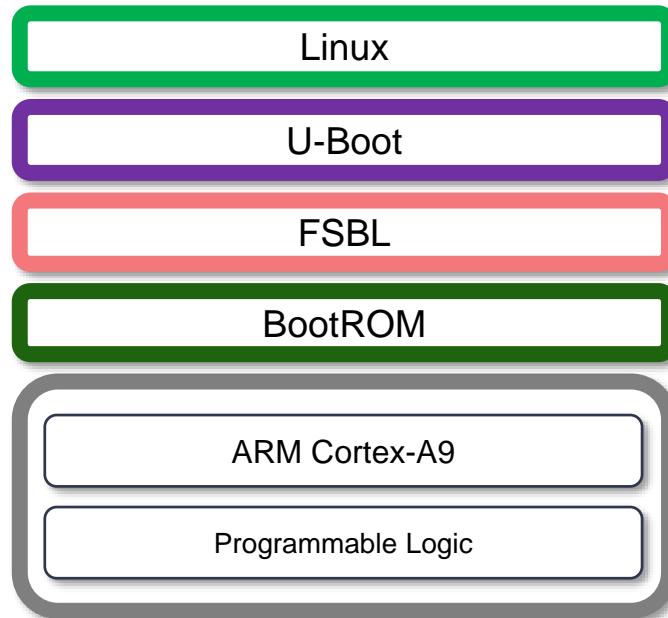

The punchline: Microsoft just unveiled a mostly open source, embedded Arm SoC design with a custom Linux kernel.

The correct response?

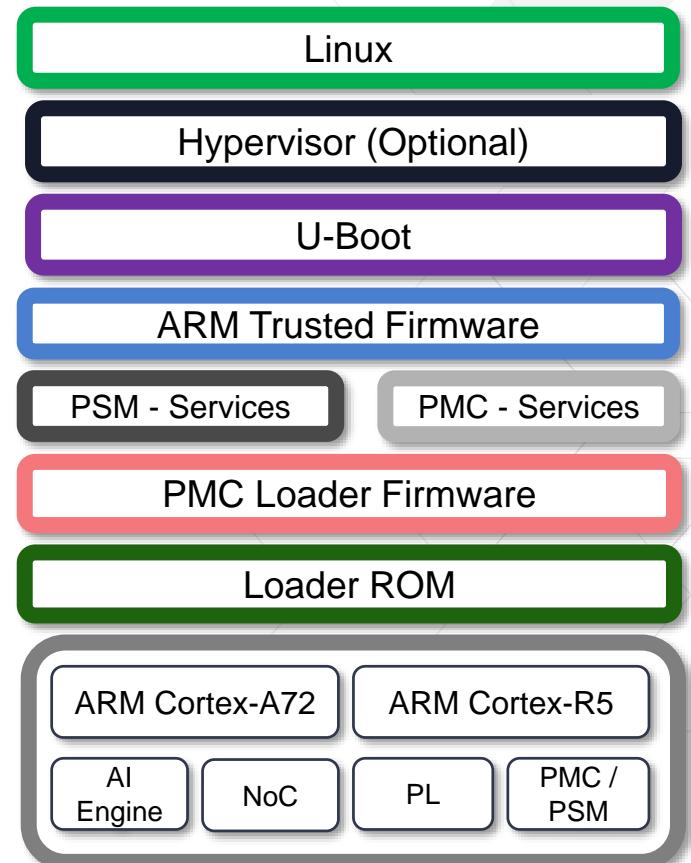

- 1. Hal! Hal! Hal! You're killing me!
- 2. Good one, dude, but April 1st was weeks ago.
- 3. Hallelujah! Linux and open source have finally beaten the evil empire. Can Apple be next?
- 4. We're doomed! After Redmond gets its greedy hands on it, Linux will never be the same.
- 5. Smart strategic move — let's see if they can manage not to screw it up like they did with Windows RT.

Microsoft's Azure Sphere announcement was surprising on many levels. This crossover Cortex-A/Cortex-M SoC architecture for IoT offers silicon-level security, as well as an Azure Sphere OS based on a secure custom Linux kernel. There's also a turnkey cloud service for secure device-to-device and device-to-cloud communication.

v2.6 (Thud)

Xen

v4.11

v4.19

The same for every device family!

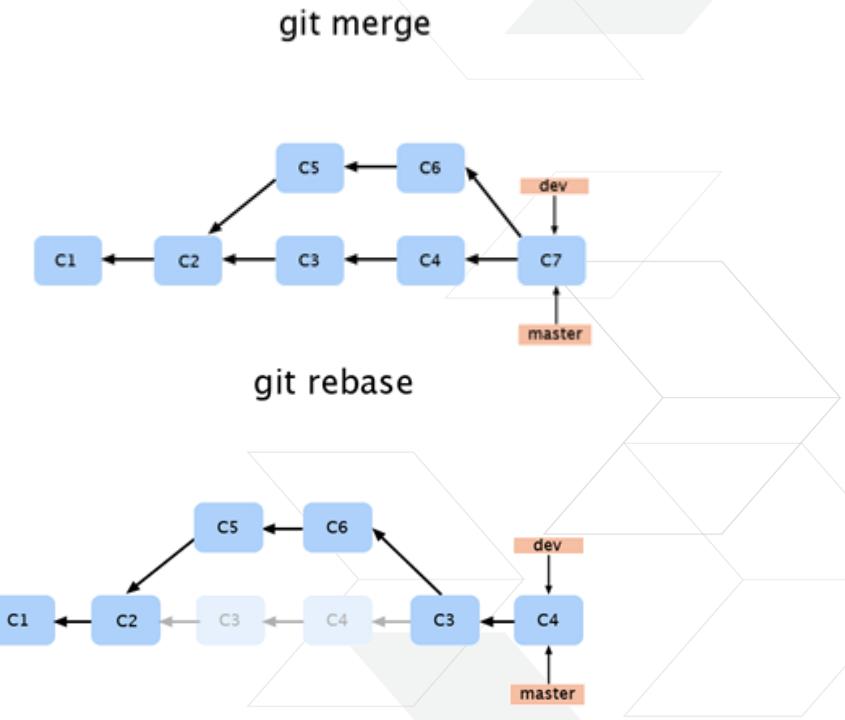

Rebase Kernel Tree

> Merge-Tree

- » Merges two separate branches into a single new branch going forward
- » Lose the history of what was different between the branches

> Rebase Tree

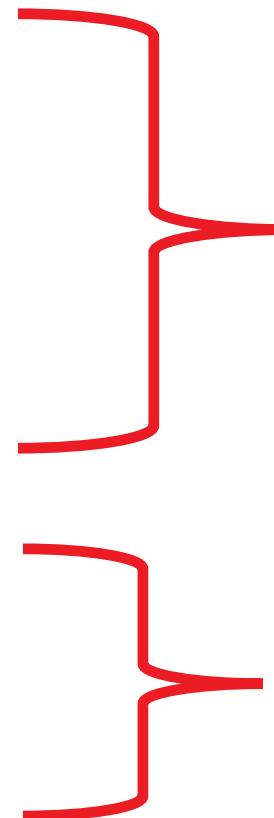

- » Creates a series of patches that can be applied cleanly to the HEAD node
- » Maintain history of development in the separate development paths

- > Single upstream kernel version per year
- > Rebase patchsets with Vivado releases
- > Rolling merge tree

Compilers and Toolchains

- > AArch32 – ARMv7 – Zynq-7000
- > AArch64 – ARMv8 – Zynq UltraScale+, Versal
- > Cortex-R5 – ARMv7 – Zynq UltraScale+, Versal
- > MicroBlaze – MMU / Linux Configuration
- > MicroBlaze – Microcontroller Configuration

Linaro **GCC 7.3.1**

crosstool-NG **GCC 7.3.1**

GCC 8 Support in 2019

Enabling Yocto

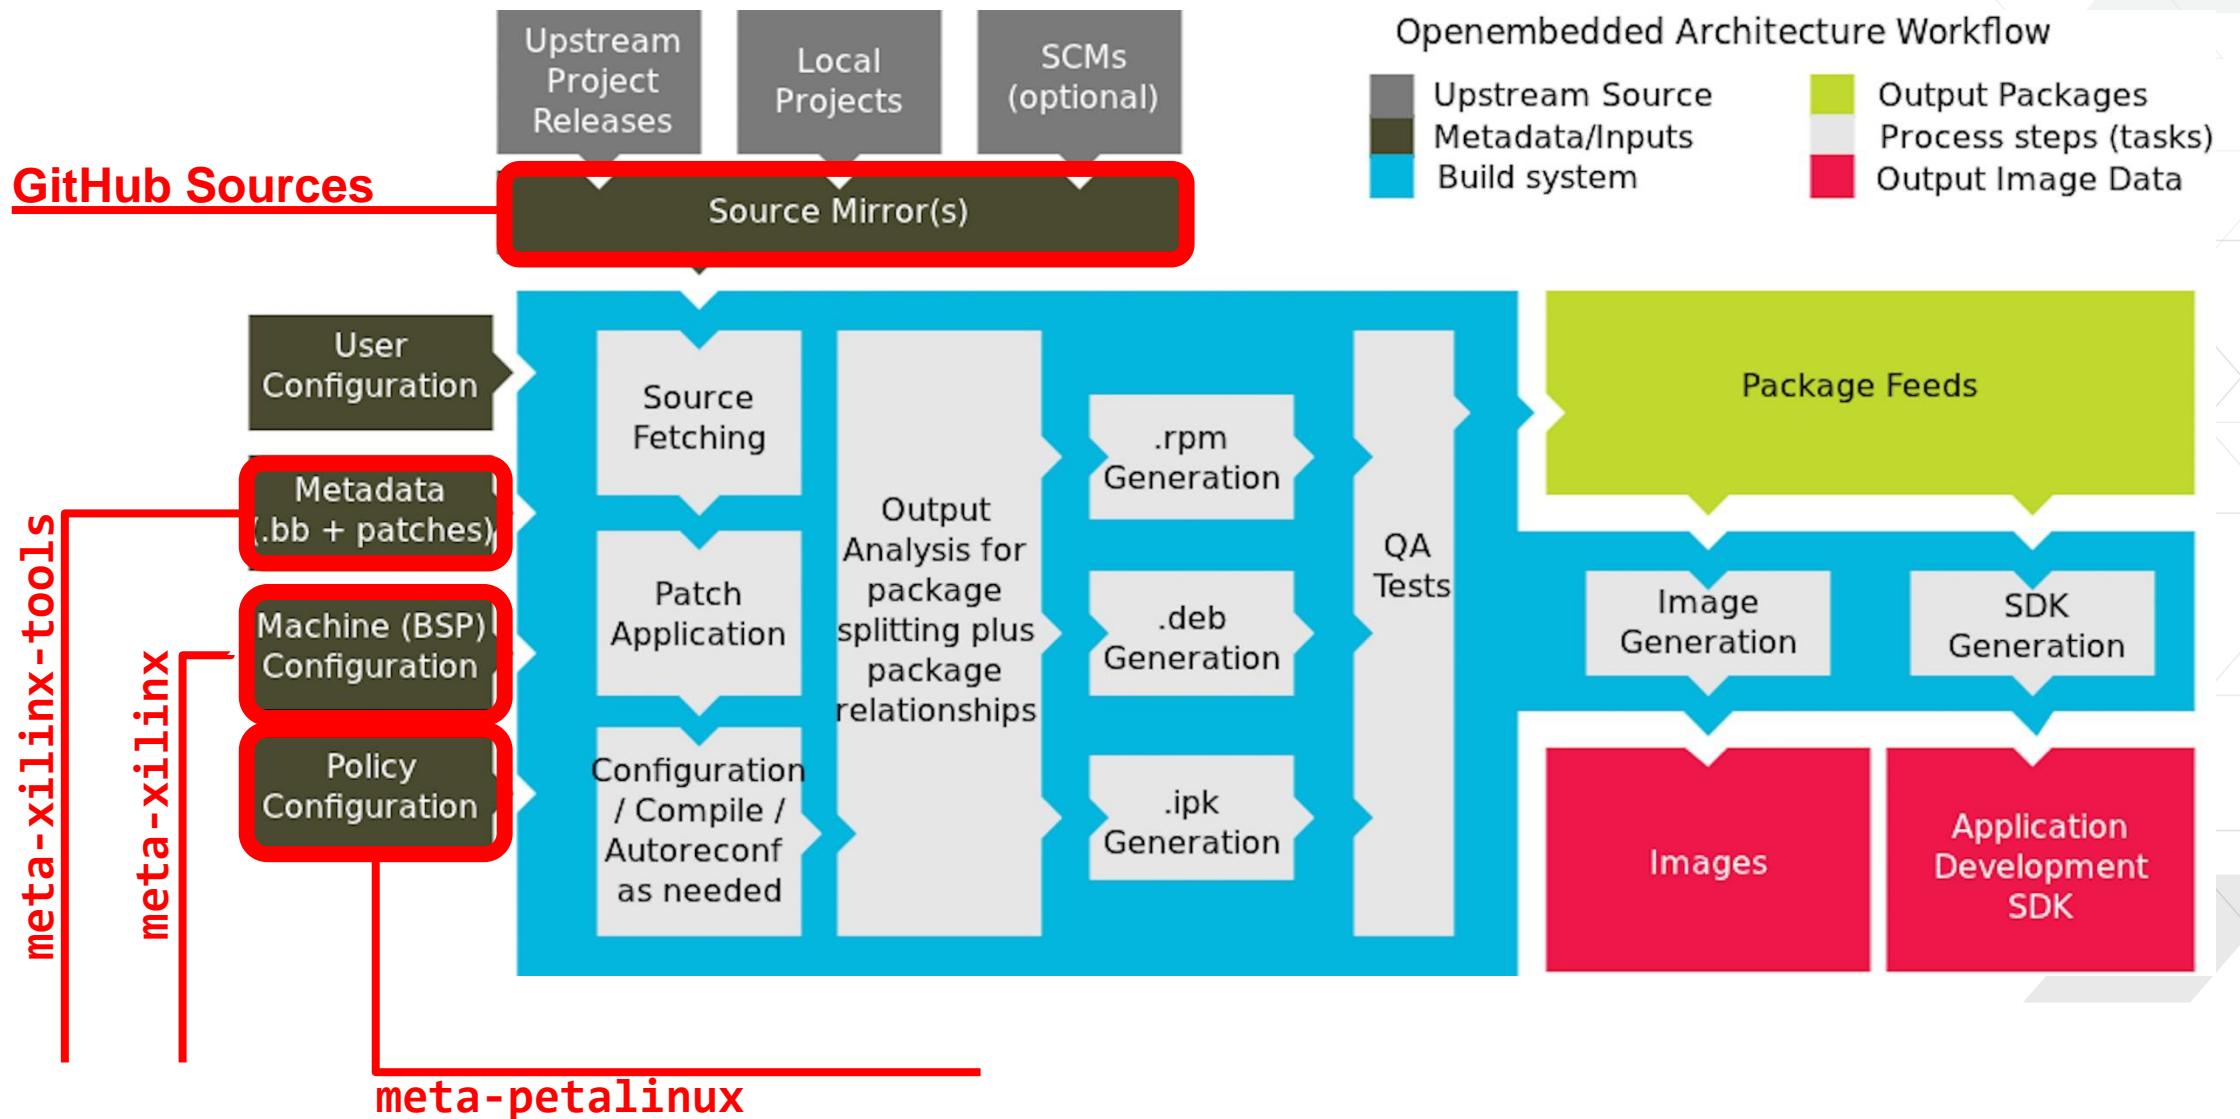

> **meta-xilinx** – BSP support for Xilinx device families

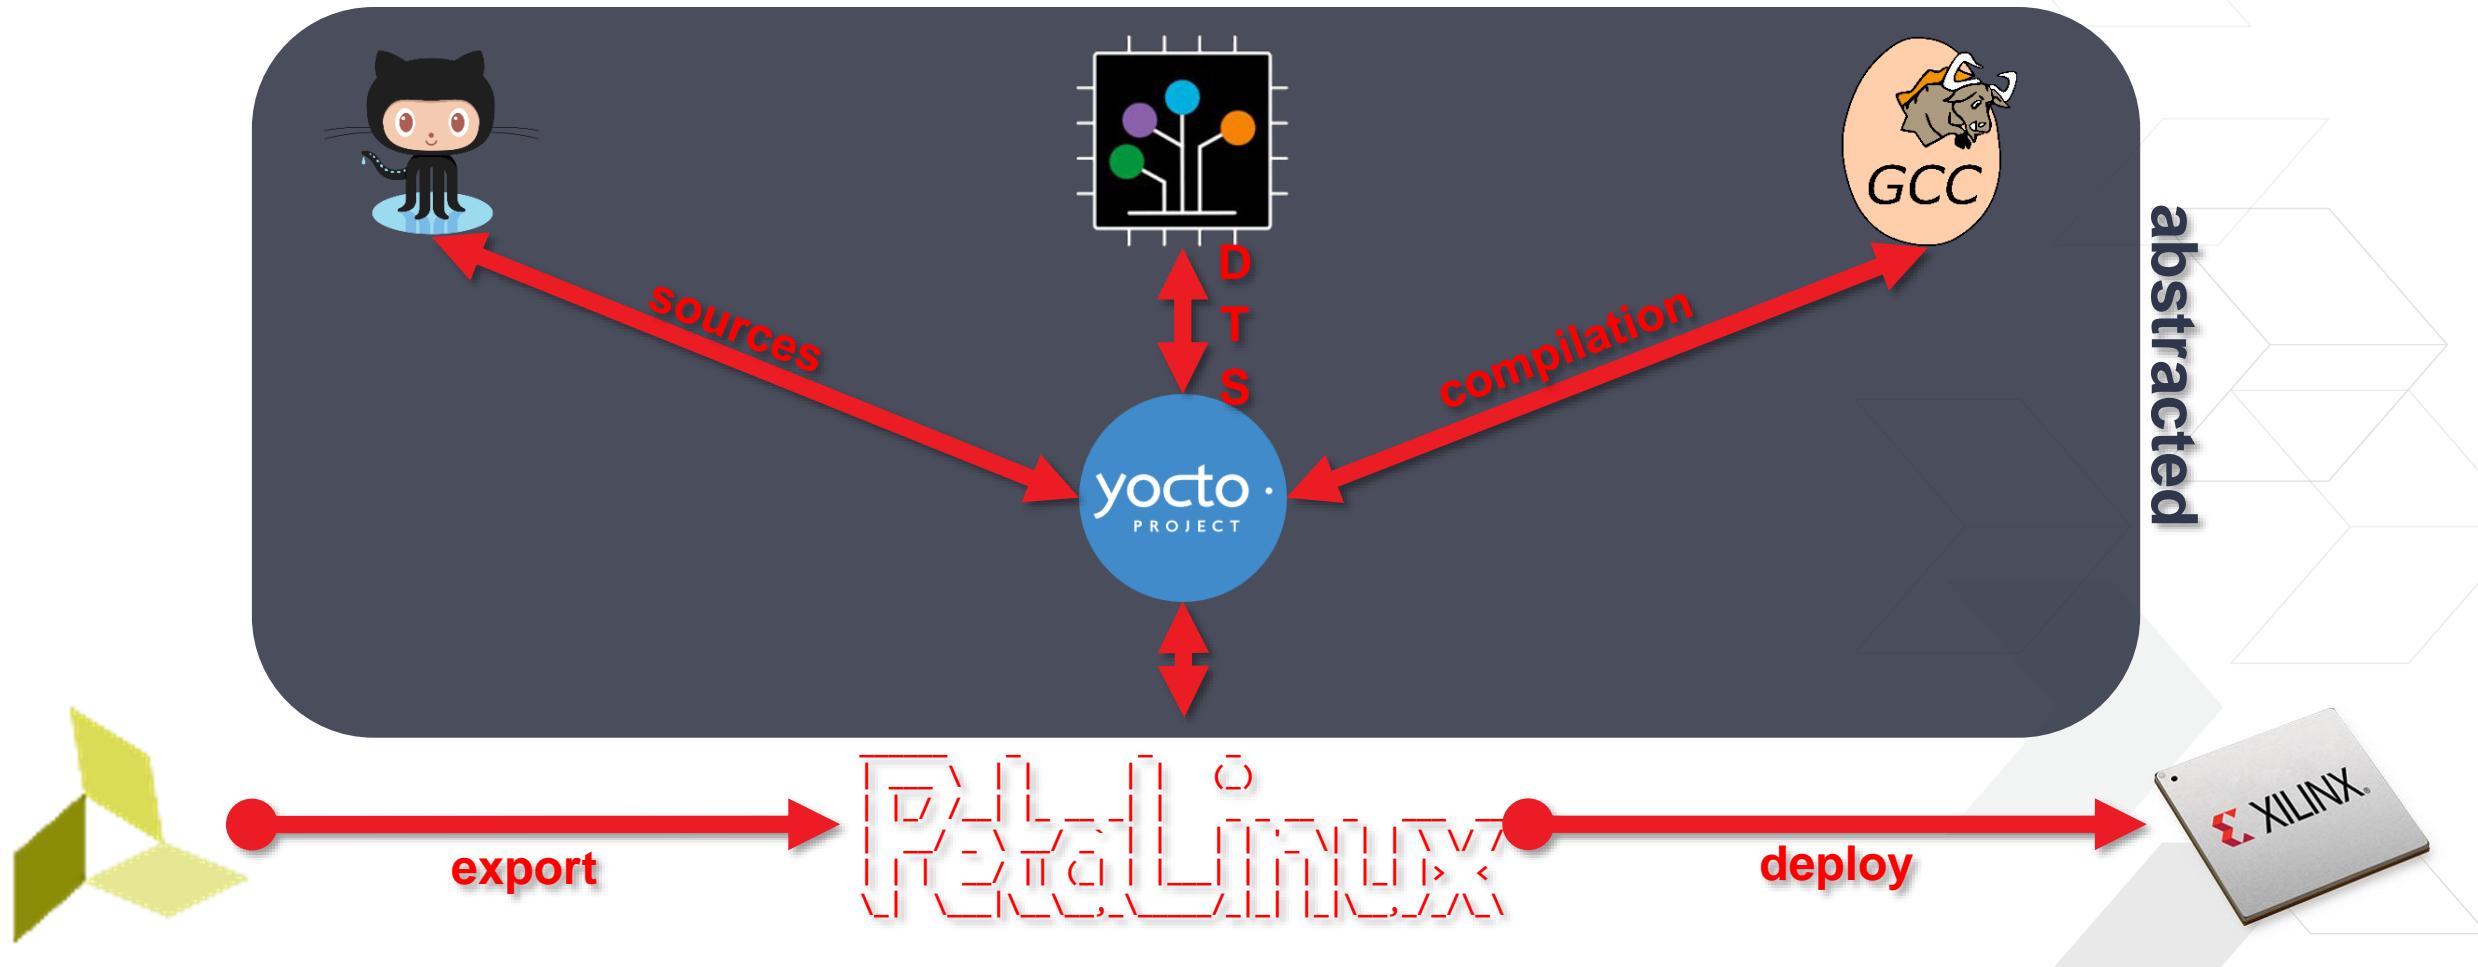

> **meta-xilinx-tools** – Yocto infrastructure to interface with Xilinx tools

> **meta-petalinux** – Infrastructure to replicate the default PetaLinux root filesystem

Integrating with Yocto

Abstracting Yocto

Multiprocessing with Xen

> Reducing code Size

> Working toward certifiability

> Dom0-less boot

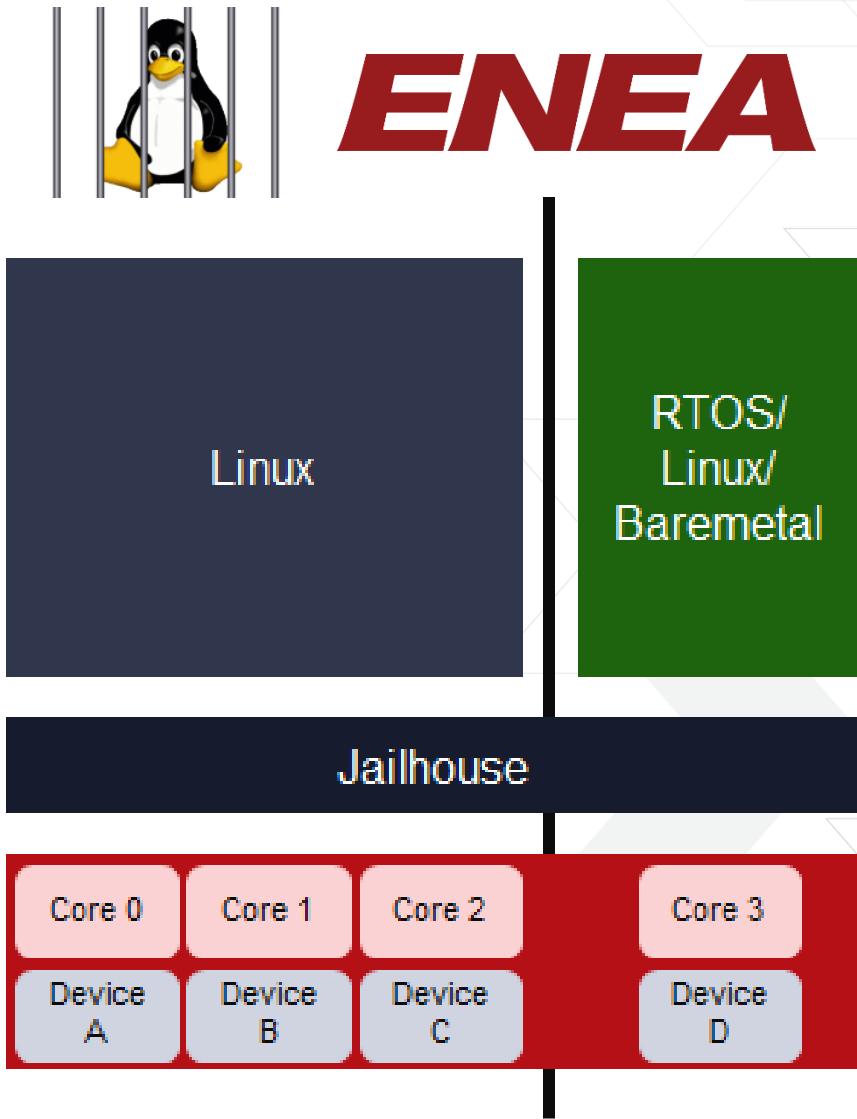

> Automatic static partitioning

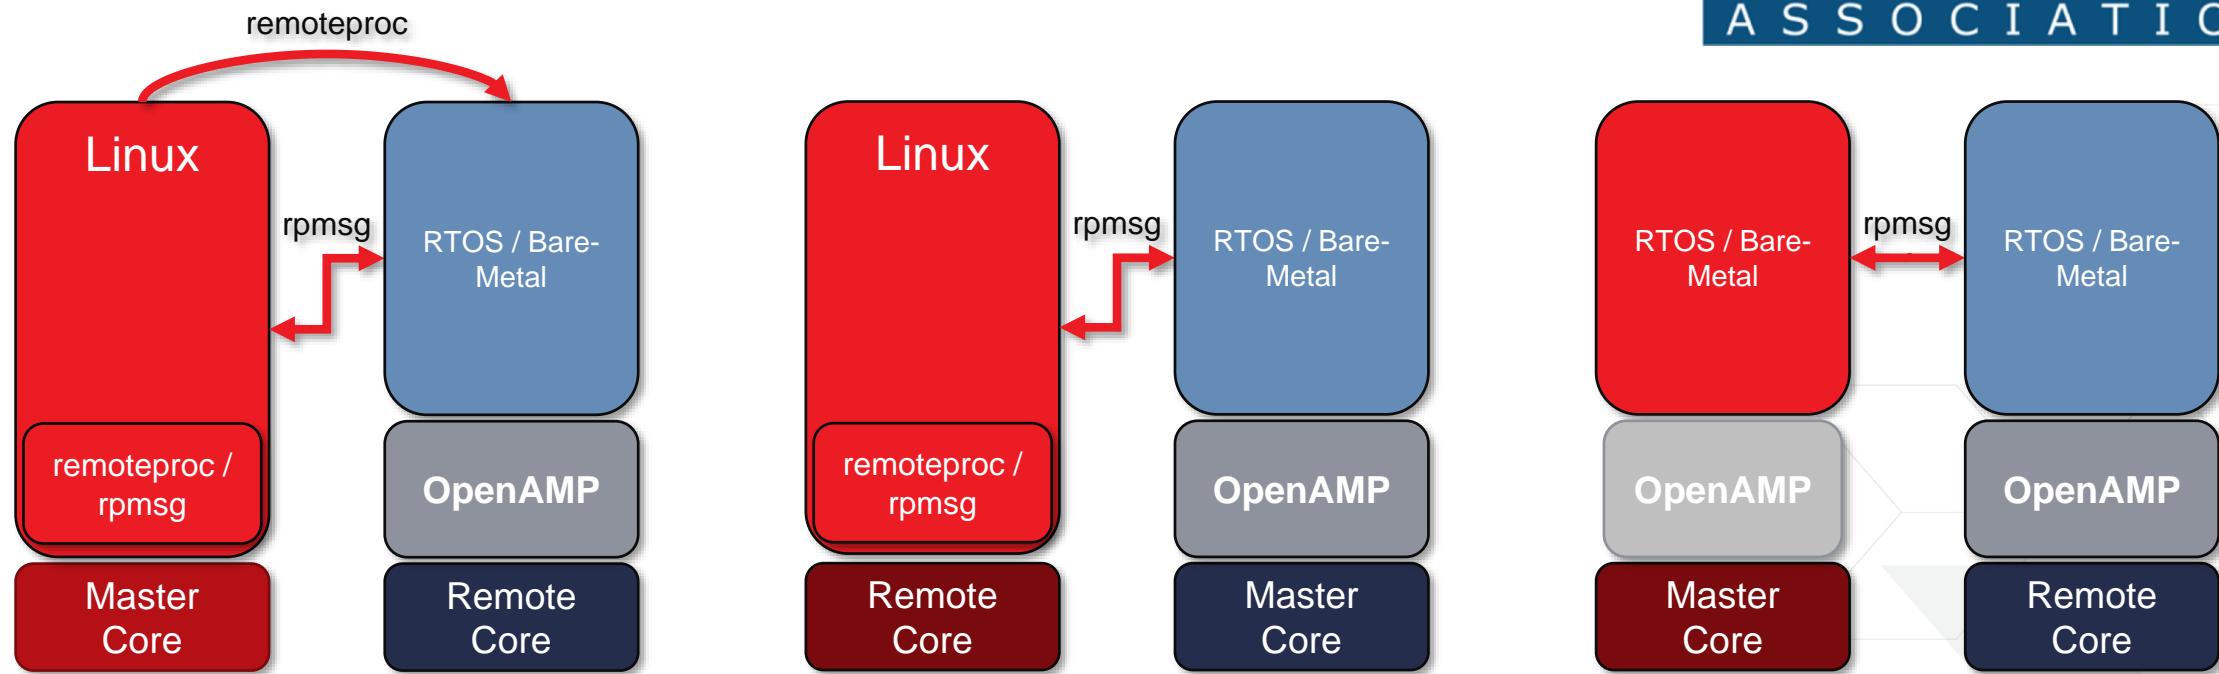

Jailhouse on Zynq UltraScale+ MPSoC

- > Done by Xilinx partner ENEA
- > Runs on standard SMP Linux without PREEMPT_RT
- > Small and fast (<10k LoC)
- > Simplifies running bare-metal code on Linux systems

OpenAMP and Interprocessor Comms

THE
Multicore
ASSOCIATION®

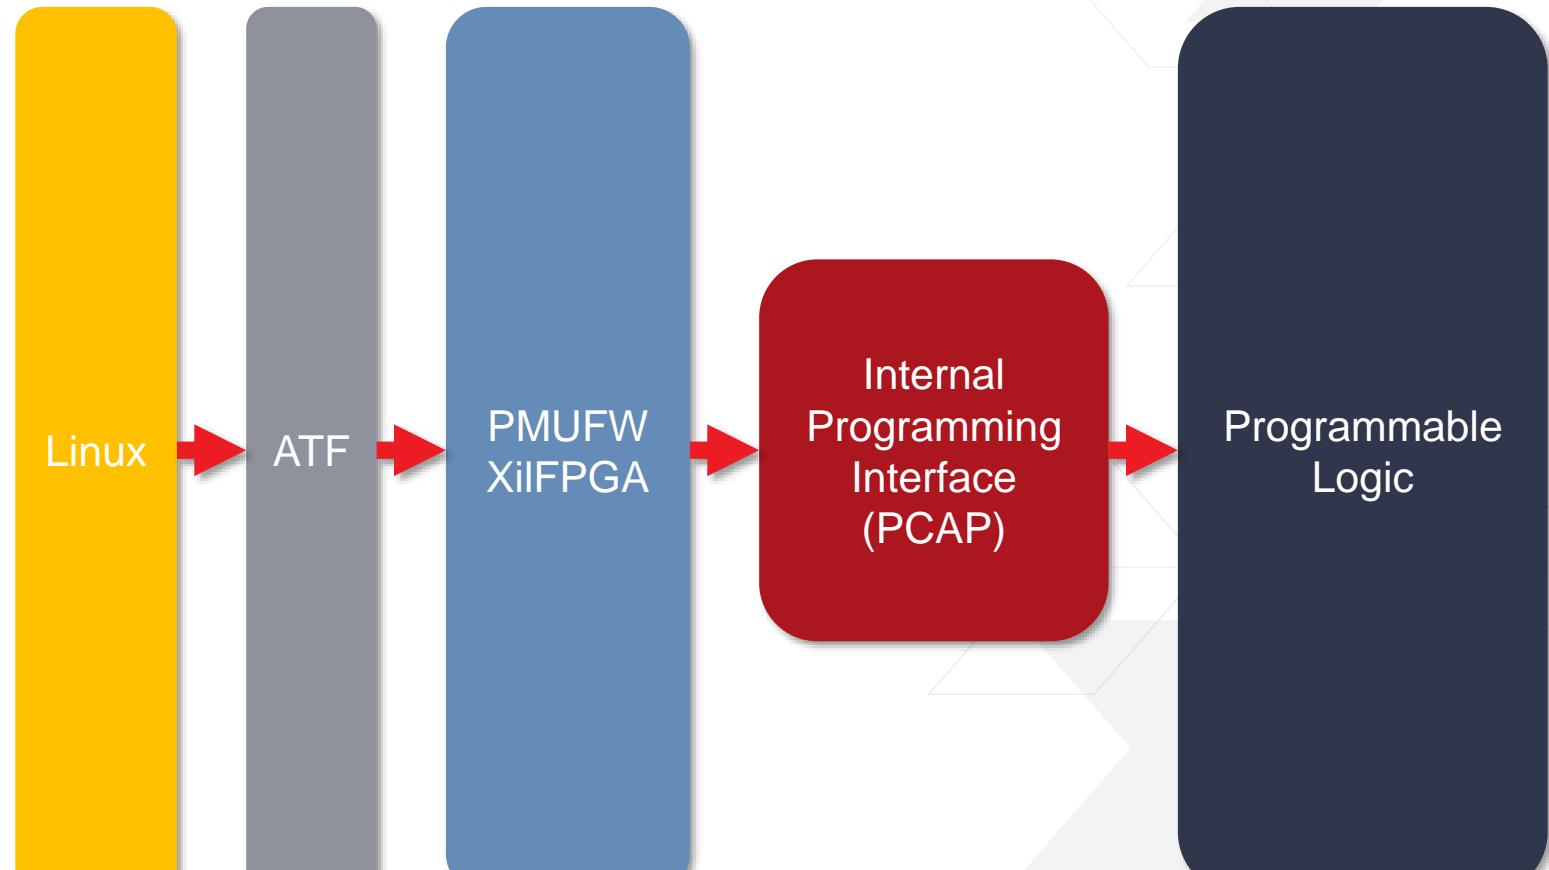

- > Built on standard remoteproc and rpmsg infrastructure
- > Open and public on [GitHub.com/OpenAMP](https://github.com/OpenAMP)
